

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended): An endoluminal stent comprising:

a. a plurality of circumferential expansion elements co-axially spaced to form a generally tubular configuration and each having a generally undulating pattern of peaks and valleys interconnected by struts, wherein the struts form generally linear sections and are interconnected at the peaks and valleys by hinge elements; and

b. a plurality of generally linear interconnecting elements interconnecting adjacent pairs of circumferential expansion elements and joined at approximate mid-points of adjacent struts along a longitudinal axis of the endoluminal stent.

2. (Currently Amended): The endoluminal stent according to Claim 1, wherein each of the plurality of circumferential expansion elements further comprises a generally zig-zag configuration along a circumferential axis of the endoluminal stent wherein the ~~struts form generally linear sections and are interconnected at the peaks and valleys by~~ struts are generally uniform in width throughout the entire section of the struts and the hinge elements ~~have~~ having a width narrower than a width of the struts.

3. (Original): The endoluminal stent according to Claim 2, wherein the plurality of generally linear interconnecting elements further comprises generally curvilinear first and second terminal sections at opposing ends of each interconnecting element that join with the struts.

4. (Currently Amended): The endoluminal stent according to Claim 3, wherein each of the plurality of circumferential expansion elements are integral and monolithic with each of the plurality of interconnecting elements ~~members~~.

5. (Original): The endoluminal stent according to Claim 4, wherein the generally curvilinear first and second terminal sections of the plurality of generally linear interconnecting elements further comprise generally C-shaped sections.

6. (Canceled)

7. (Currently Amended): The endoluminal stent according to Claim 1, wherein the plurality of generally linear interconnecting elements ~~members~~ are all parallel to each other.

8. (Currently Amended): The endoluminal stent according to Claim 1, wherein the plurality of generally linear interconnecting elements ~~members~~ are arrayed as at least two groups of interconnecting elements ~~members~~ along a longitudinal axis of the endoluminal stent, a first of the at least two groups having a different angular orientation relative to the longitudinal axis of the endoluminal stent than a second of the at least two groups.

9. (Original): The endoluminal stent according to Claim 1, wherein the endoluminal stent elongates along the longitudinal axis of the endoluminal stent as it expands from a smaller diameter to a larger diameter.

10. (New): An endoluminal stent comprising:

a. a plurality of circumferential expansion elements co-axially spaced to form a generally tubular configuration, each having a generally undulating pattern of peaks and valleys interconnected by struts forming a generally zig-zag configuration along a circumferential axis of the endoluminal stent wherein the struts form generally linear sections and are interconnected at the peaks and valleys by hinge elements having a width narrower than a width of the struts; and

b. a plurality of generally linear interconnecting elements comprising generally curvilinear first and second terminal sections at opposing ends of each interconnecting element that join with the struts, each of the generally curvilinear first and second

terminal sections of the plurality of generally linear interconnecting elements further comprising generally C-shaped sections having a width narrower than a width of the remainder of the interconnecting element, the plurality of generally linear interconnecting elements interconnecting adjacent pairs of circumferential expansion elements and joined at approximate mid-points of adjacent struts along a longitudinal axis of the endoluminal stent; and

wherein each of the plurality of circumferential expansion elements are integral and monolithic with each of the plurality of interconnecting elements.

11. (New): An endoluminal stent comprising:

a. a plurality of circumferential expansion elements co-axially spaced to form a generally tubular configuration and each having a generally undulating pattern of peaks and valleys interconnected by struts; and

b. a plurality of generally linear interconnecting elements interconnecting adjacent pairs of circumferential expansion elements and joined by strain relief sections at approximate mid-points of adjacent struts along a longitudinal axis of the endoluminal stent.
